

## Live Viewing on Mobile Devices, MAC/PC, Safari, Firefox, Opera & Chrome

Beginning in May, 2010 EverFocus has introduced a capability on Paragon, Paragon264 and ECOR264 series DVRs which provides remote access to live camera views from web capable ‘Smart Phones’ and web browsers other than Internet Explorer. To use this mobile device viewing function:

- 1) The DVR must be accessible from the Internet via the same process usually employed for DVR remote viewing:
  - a. the DVR IP configuration must be consistent with the local network
  - b. the router in the system must be configured to forward any traffic for the HTTP port used by the DVR to the IP address of the DVR. Please refer to the DVR User Guide for setting up the DVR network configuration.
- 2) In the Configuration Menu Network Setting Screen, the new option in the LAN setup “Enable Mobile Viewing” must be checked.

To view, launch the web browser on the mobile device or PC and enter the URL in the form

<http://AAA.AAA.AAA.AAA:PPPP/m/live.htm> or <http://dvrddnsname.everfocusddns.com/m/live.htm>

where AAA.AAA.AAA.AAA is the IP address of the DVR  
PPPP is the HTTP port used by the DVR  
dvrddnsname is the DDNS name registered with the Everfocusddns.com server

You will be prompted for the login ID and password to access the DVR. Please remember that the ID is case sensitive; the password is numeric. After entering the ID/password, choose “OK” or “Log In” and you will see the live view screen. Click on a camera button to select that camera.

For a list of Smart Phones reported to operate with Mobile View, please go to
